

Vaporizers Categories

Simply put a vaporizer is any device that heats a substance, typically herbs or tobacco, to a point where the essential elements a user is trying to extract are released without burning the substance. This allows a person using a vaporizer to get more of the elements from their herbs they are looking for with less smoke and cancer causing agents like tar. This is the one question that most users are always asking. Many people have tried the "dome" style vaporizers like the BC vaporizer or other past vaporizers and have decided that vaporizers just don't work. Don't judge the Vapor Brothers based on these other vaporizers. The typical vaporizer is the only vaporizer that can really reproduce the experience of smoking. The design allows you to take very large hits like you would with any water pipe and still produces no smoke. If you are a hard core users and are reluctant to believe a vaporizer can work give the typical vaporizers a try. You won't be sorry! The volcano vaporizers is the one vaporizer we have found that can reliably replace the water pipe of even the most hard core user. This is yet to be fully decided and there are no claims anyone can make that vaporization is healthier than smoking. There has been a MAPS Vaporization study however that has shown that Vaporizers Reduce Toxins in Marijuana smoke. Also if you ask any vaporizer user they will tell you that they caught up less phlegm and generally feel it is better on the throat and lungs. All vaporizers operate on the same general principles, however there are some differences in how the herbs are heated and the way in which the vapor is delivered to the lungs. Indirect Heating - This is the method that the Vapor Brothers and Vapor Doc both employ. With indirect heating the herbs themselves are not heated directly, i.e. they never touch a heating element. Instead glass is heated and then air is drawn over the glass to heat the air, this air then passes over the herbs heating them very rapidly and allowing them to release their essential elements. Indirect heating produces the very best vapor flavor possible. Direct Heating - This is the method that the "dome" vaporizers use and some others on the market. With direct heating the herbs are placed on a metal plate and this plate is heated until the herbs begin to release their essential elements. This method works fine, however the taste created by this method is not nearly as nice as with the indirect heating, also having metal touching your herbs directly can sometimes cause them to burn, or create undesired flavors.
